1. About this Migration Guide

1.1. Background

CREST WebGUI+, Euroclear UK and International's new Web GUI application, is the first stage of transformation for the CREST interactive system. The initial launch is a migration from the existing dedicated application onto a web platform, including some key enhancements such as improved dual authorisation, with screens and data otherwise remaining largely the same. By moving onto a web platform, the interactive system is positioned to support the upcoming CREST transformation; as each service is modernised over the coming years, new screens with enhanced features can be automatically rolled out without the need for extensive deployment at the client-side.

1.2. Document Scope

This guide is intended for users familiar with the current CREST Graphical User Interface (GUI). It provides general guidance on migrating from the current (legacy) GUI onto the Web GUI, and a non-technical overview of changes introduced in the Web GUI, such as changes in navigation and new features.

1.3. Other Documents

1.3.1. Related Files:

Guide on creating Operators, Member Accounts, Caps and CMAs within CREST using the Web GUI:

[CREST WebGUI+ Operational Setup Guide](#)

1.3.2. Related Web Pages:

All Web GUI related documentation:

[CREST Web GUI+ Documentation](#)

Technical information, API download, technical attestation:

[CREST Web GUI+ Technical information](#)

Training Videos & PAT attestation:

[CREST Web GUI+ Operational info - Euroclear](#)

2. Preparing for Go-Live

2.1. Requirements for go-live

To go live with the Web GUI, the following conditions must be met:

1. Technical installation must be complete, along with a successful connectivity test and attestation.
2. Participant Acceptance Testing (PAT) must be complete, and an attestation submitted.
3. Notification of the go-live date must have been received from EUI

See the [Other Documents](#) section for assistance with technical installation and PAT.

2.2. Recommended go-live approach

Once the go-live conditions are met, clients may begin utilising the Web GUI for live operations. However, the legacy GUI will remain available alongside until Q4 2026. This means that a 'big bang' migration of all users on the same day is not necessary. Instead, a cautious approach is recommended, with live operations moving onto the Web GUI in phases. For example, the following approach may be employed:

Phase 1 – Initial Onboarding

- Select a small subset of operators to trial core business functions
- Run alongside operations with the Legacy GUI
- Capture usability feedback and report any anomalies

Phase 2 – Controlled Expansion

- Gradually extend to additional operators and more complex process once confidence is established
- Focus on low-risk, high volume processes (enquiry, reporting, non-settlement tasks)

Phase 3 – Full Transition

- Transition remaining operators

2.3. Getting in contact

During the technical installation phase:

- Email euiwebgui@euroclear.com
- Contact your Account Manager (EUI-AM@euroclear.com if unknown)

During the PAT phase:

- Email PAT_Support@euroclear.com
- For urgent queries only, call **020 7849 0006**

For live operations using the Web GUI:

- Email EUI_CREST_Ops@euroclear.com
- Call **08459 645 648** (From outside the UK: **+44 207 849 0199**)

3. Using the Web GUI

3.1. Overview of changes

The Web GUI represents a significant transformation in both function and appearance compared to the legacy interface.

Instead of running in a dedicated application, the Web GUI is accessed via a Chrome or Edge browser. If you previously used multiple legacy GUI installations – for example, to access more than one user – this setup is now replaced by multiple Web GUI URLs. If both need to be accessed at the same time, this can be achieved by using two different browsers (for example edge and chrome) or by creating extra instances in incognito/private browsing mode.

The Web GUI's updated look and feel incorporates user-centric design features and usability enhancements to deliver an intuitive experience. This promotes ease of use, improves operational efficiency, and ensures closer alignment with standardised business processes.

3.1.1. Logging in

The login process has a new appearance compared to the legacy GUI but has not experienced any major functional changes. All operator credentials will remain the same as the legacy GUI.

Upon opening the CREST GUI, the Environment Select screen will be displayed (Figure 1). Here, an environment should be selected from the list (e.g. Live). This screen also displays contact details for CREST operational support.

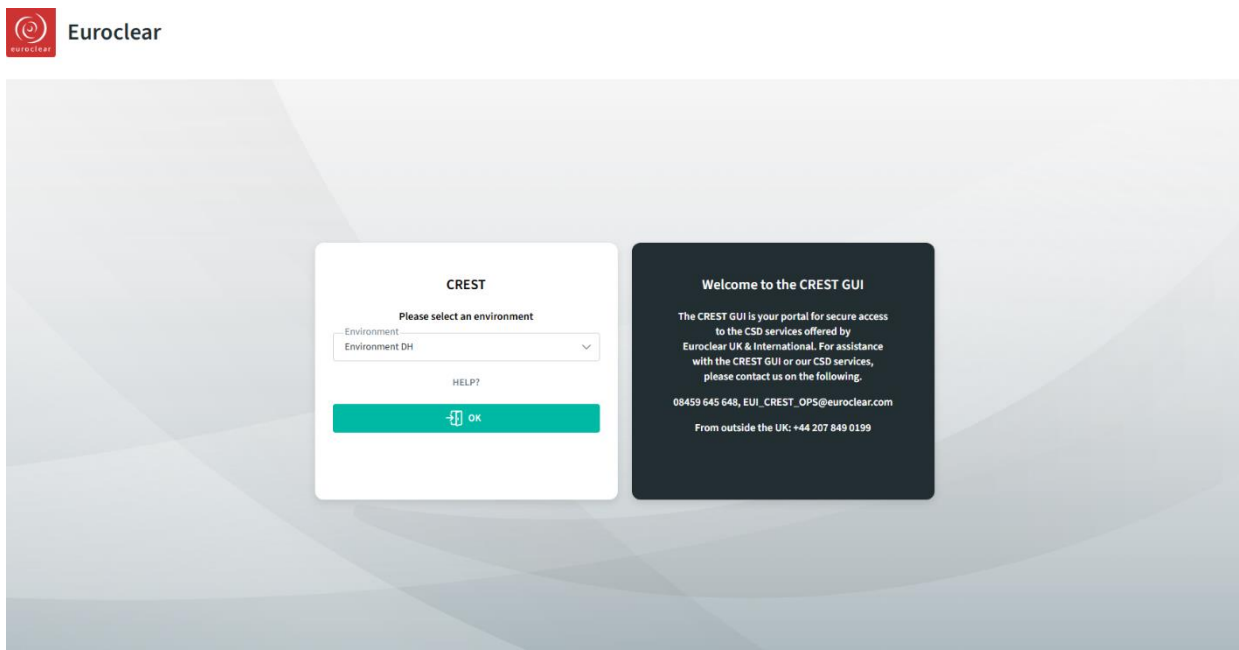

Figure 1

Once an environment has been selected, SWIFT users will be directed to the SWIFT sign on screen (Figure 2) and must enter their gateway logon details to proceed. BT users will skip this screen.

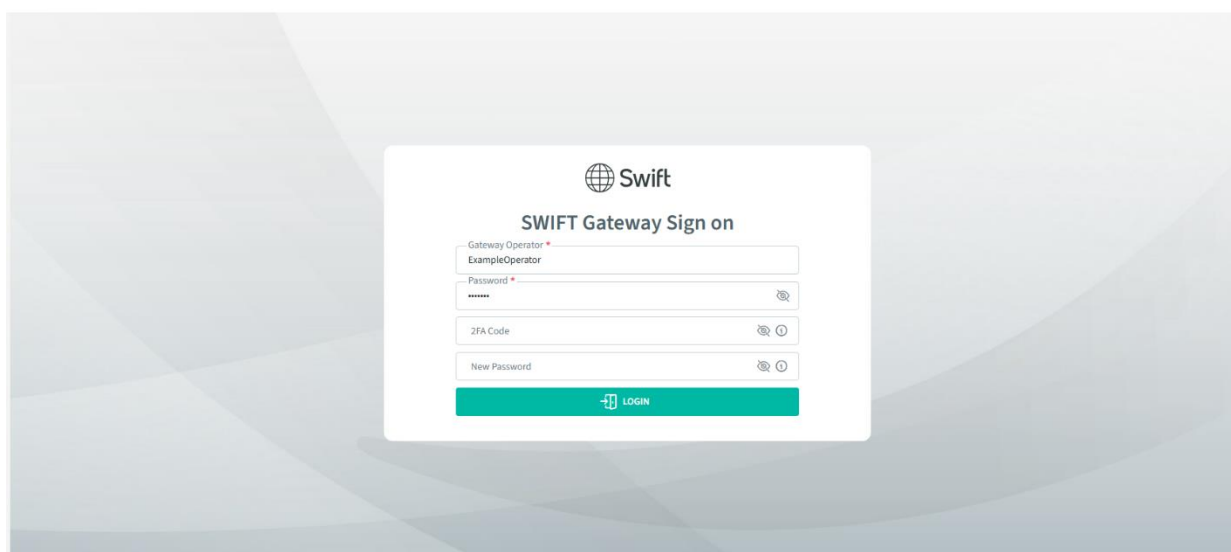

Figure 2

Once an environment has been selected and the SWIFT gateway sign on has been completed (if applicable) the CREST Login screen will be displayed. The User ID, Operator Reference, and Password must be entered.

If authorisation is required to log in, the Authorising Operator Reference and Password may also be entered.

If the Operator Password has expired, or the Operator is logging on for the first time, a Change Password overlay will open when attempting to log in.

Optionally, a Participant ID may be entered to immediately act as the specified participant upon logging in. This no longer has the legacy GUI restriction of having to be preconfigured to function.

The page now includes a 'Save Details' checkbox. When checked during login, all non-password fields are saved and will auto-populate on future visits. This box does not need to be checked on each login, however, it may be checked again to overwrite the currently saved information with newly entered details. Details are stored in the browser and will be cleared if browser data is deleted.

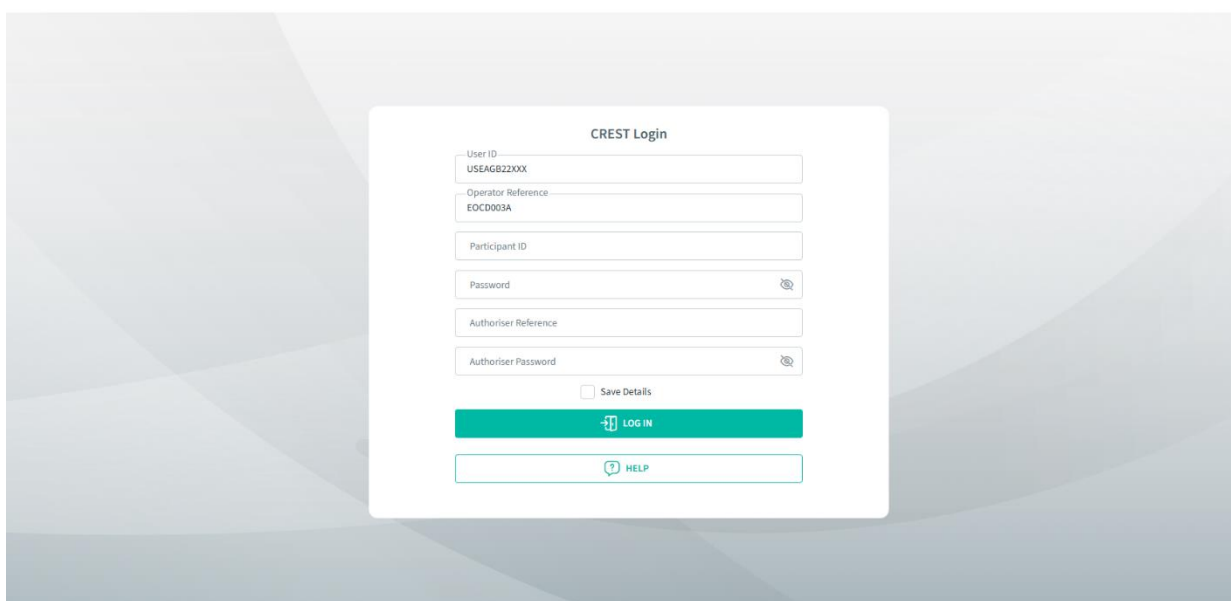

Figure 3

3.1.2. Home Screen

After successfully logging into the Web GUI or changing participant, the home screen will be displayed. This contains Quick links to frequently used screens which adjust based on context; when not acting as a participant, the links shown relate to operator specific actions or non-participant data such as securities or corporate actions. When acting as a participant, the links reflect the participant type, for example, transaction, balance, and postings screens for members.

The links are not configurable in the initial Web GUI launch, though this is being considered as a future enhancement. Frequently used screens may instead be added as a favourite within the menu.

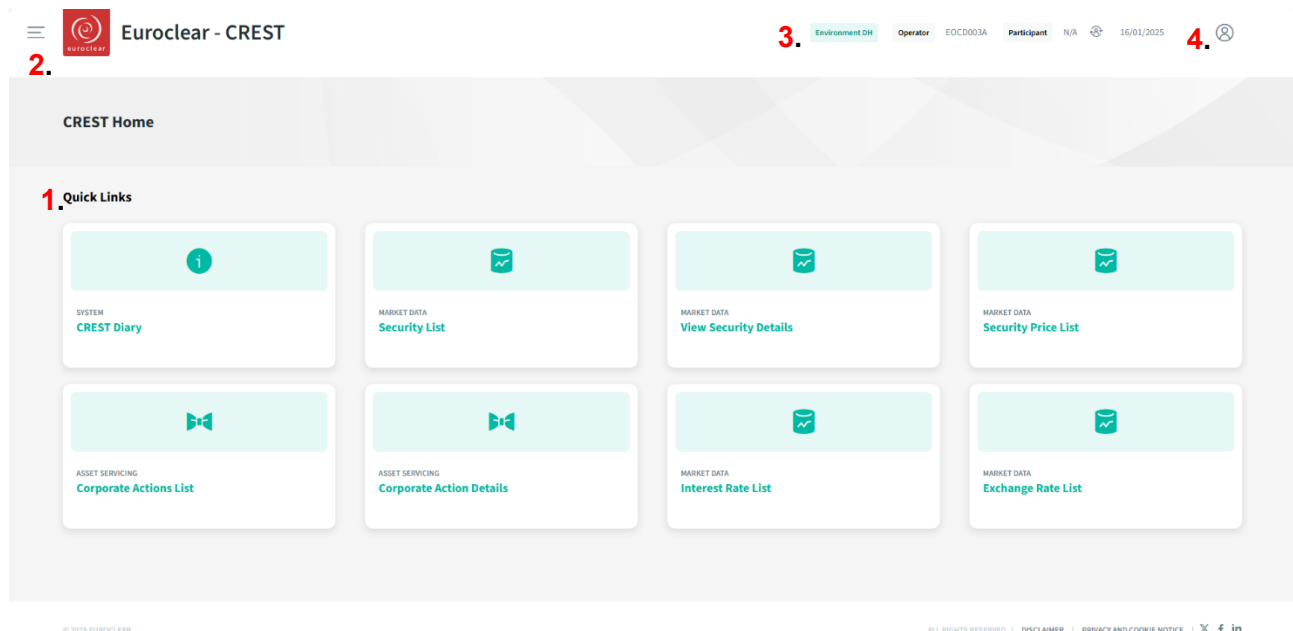

Figure 4

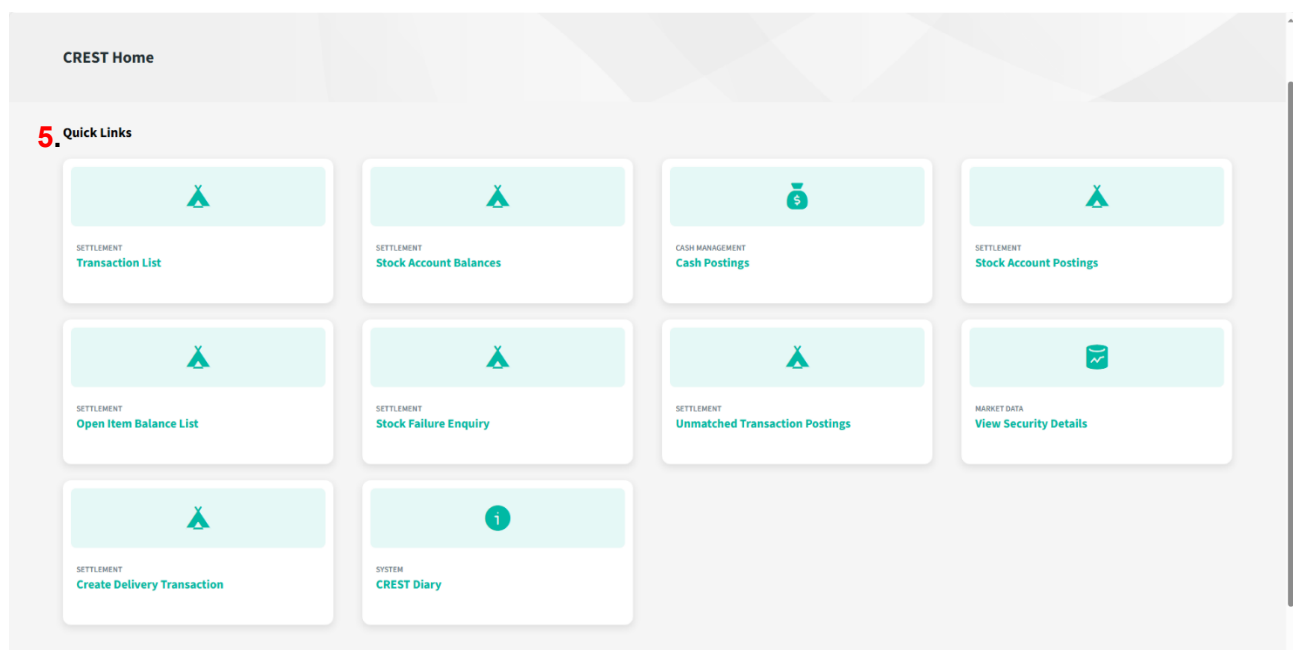

Figure 5

The following are the key features on the Home screen, as highlighted in Figure 4 and 5 above:

1. Home page quick links. Clicking the screen name will navigate to the desired screen without having to use the menu.
2. The button to open the main menu which lists all screens available to the current participant/operator type. The Euroclear logo can be pressed to return to the home screen.

3. The Status Bar, showing some information about the current session and environment.
4. The button to open the User Session Menu, where session information can be found, and certain specific functions are reached from, such as acting as or viewing participants.
5. The Home page quick links will change after swapping from an ordinary operator (no participant) to a 'Member' type participant.

3.1.3. Overlays and Multi-Window Support

The change from the legacy GUI - a multi-window application, to the Web GUI – a fullscreen webpage-based application, comes with a fundamental change to the experience of using the interface.

In the legacy GUI, each screen opens as a new window, with multiple windows often fitting in the screen at the same time depending on the size of the screen. This makes it very easy to view data side-by-side, but comes with the consequence of requiring the user to manually close any screens they are finished with to prevent the application becoming cluttered, as screens do not close on their own.

The Web GUI is designed as a single-screen application, with only one screen shown at once. Like other webpages, the current screen is overwritten when users navigate to a new page. In many cases this is acceptable, but depending on the task, the user may wish to return to the previous screen, or view screens side-by-side.

If a user needs to return to a previous screen, the browser back button may be used, but many screens that are related to the one currently being viewed (such as viewing a transaction from a list) will open in an overlay rather than navigating away (Figure 6). This allows the user to simply close the overlay using the 'X' button in the top-right corner to return to the previous screen or overlay.

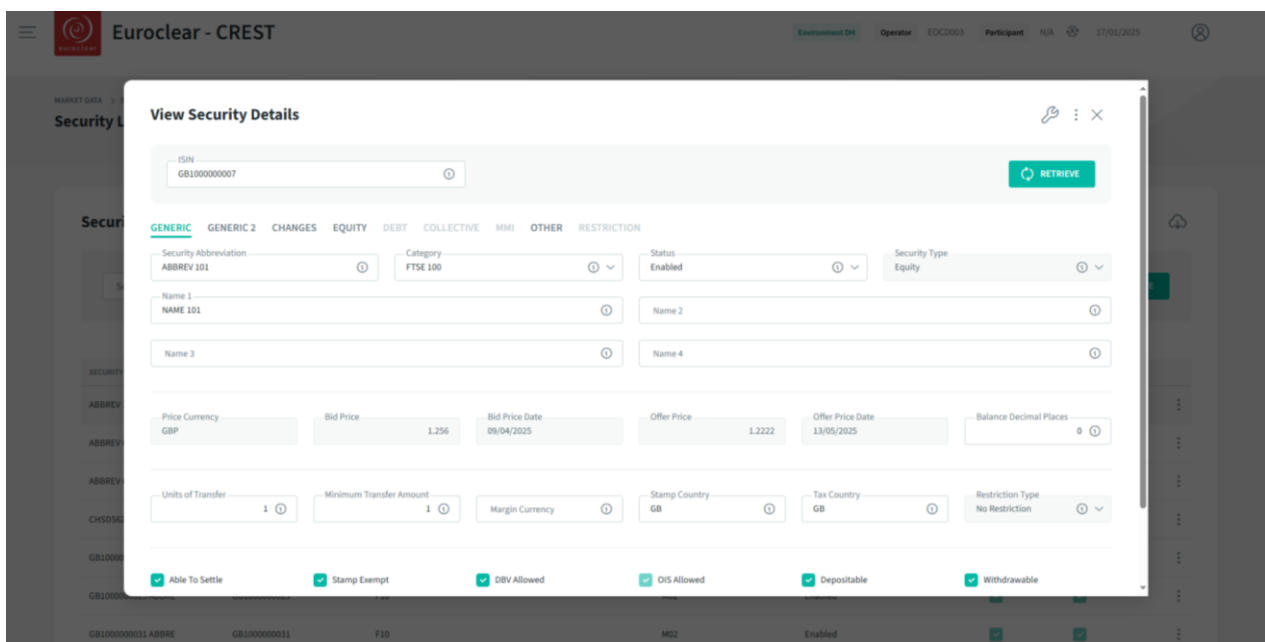

Figure 6

To enable users to view data side-by-side, pages may be opened in a new browser tab by right-clicking when opening the page and selecting 'Open link in new tab/window/split screen' (Figure 7). The second screen may then be used as another tab to navigate between, placed in another monitor, or split across the same monitor (Figure 8) which may zooming out the browser.

When using more than one screen, users may only act as one participant or log in as one operator at a time. Once the participant or operator is changed, the other screen will become out of sync. Any data shown is still displayed, but when an action is taken, such as retrieving a screen, the screen will update to the new context. To use more than one user or participant at the same time, separate browsers must be used.

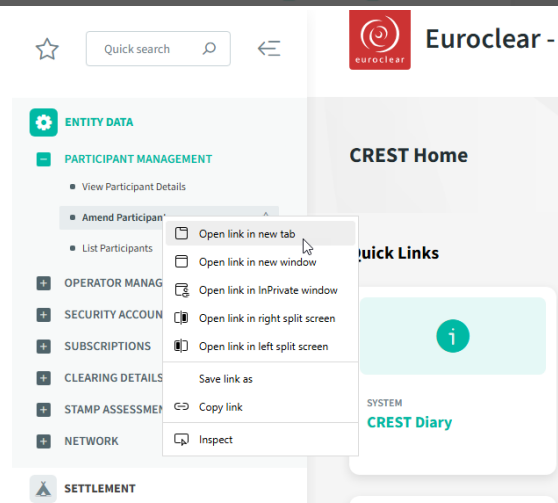

Figure 7

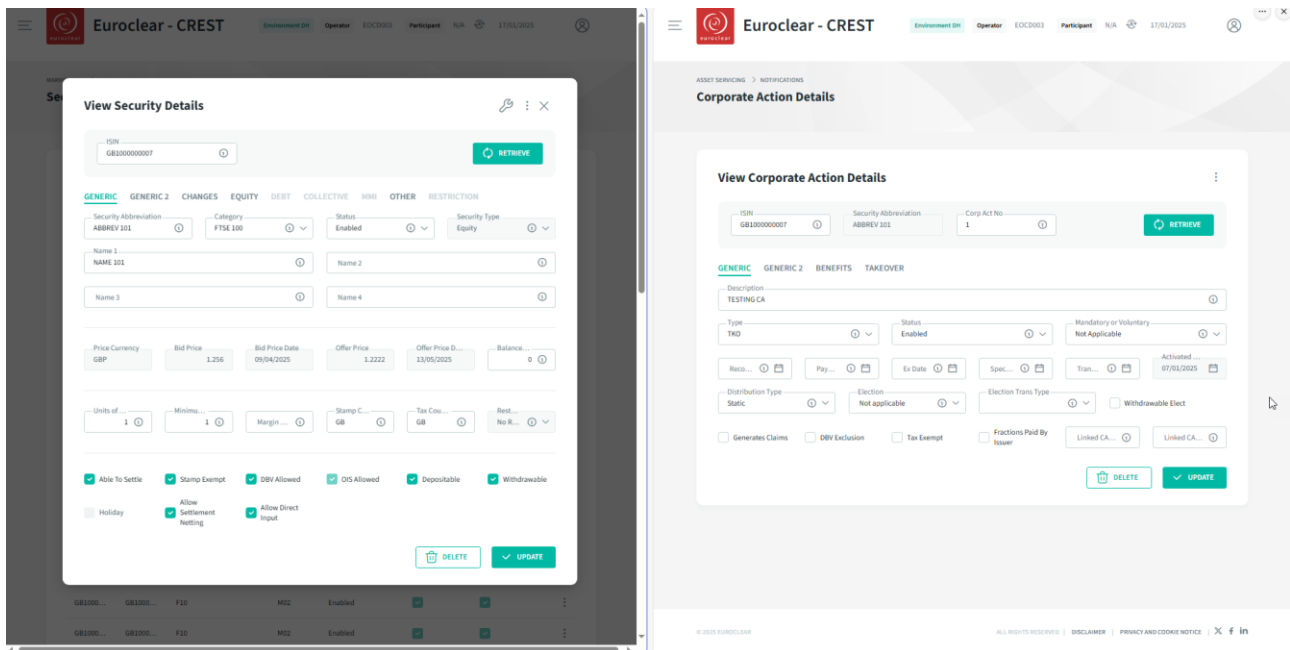

Figure 8

3.1.4. Menu Changes

The Web GUI menu has received significant changes compared to the legacy system's menu, including altered screen categories and new quality-of-life features.

3.1.4.1. Menu Category Changes

CREST screens have been recategorised based on business area rather than by function. In the Legacy GUI, *Transaction* would contain all transaction screens regardless of business, and *Base Data* would contain a mix of client data and market data. Under the new categorisation, transactions are split into the area specific for the transaction type – *Settlement*, *Asset Servicing*, or *Collateral Management*. Client data including Participants and Member Accounts will be in *Entity Data*, with information such as security data and pricing moving to *Market Data*.

The new top-level categories contain additional subcategories within for better organisation. Screens and Categories will appear and disappear based on context, e.g. transaction screens will not appear while not acting as a participant. The list below shows all top-level categories along with a non-exhaustive description of each.

- **Entity Data** – Data about CREST entities that isn't specific to another business area, such as User, Participant and Member Account data, along with Operators and ISO subscription settings.
- **Settlement** – Core settlement functions: DEL, OAT, XDL, STD, STW, RES. Settlement enquiry screens are also located here such as the Transaction List, Stock Postings and Open Positions, along with other functions like Splitting and Bulk Upload.
- **Asset Servicing** – Asset Servicing data, functions, and supporting transactions. TTE, ESA, TFE, USE, PAY, MTM. Contains Corporate Action data, Meetings, Proxy Voting, and Buyer Protection.
- **Collateral Management** – Screens for collateral related movements such as SLO and DBV/TDO. Also contains all other supporting collateral screens such as those to manage returns, lifecycle events, and monitoring.
- **Cash Management** – Cash specific functions and data, such as Cap and CMA management along with cash postings.
- **Payment Bank** – Contains data and functions specific for CREST payment banks and is therefore not visible to other participant types.
- **System** – Specific CREST functions not relating to a business area, such as the new Dual Authorisation List, CREST Diary, and Broadcast Messages.

- **Market Data** – Data originating from the market such as Security Details, Security pricing, exchange and interest rates. Does not contain corporate action data about securities as this is placed under the Asset Servicing menu.
- **Registration** – Information and functions relating to the registration and reconciliation of securities, along with screens specific to Gilts and MMIs.

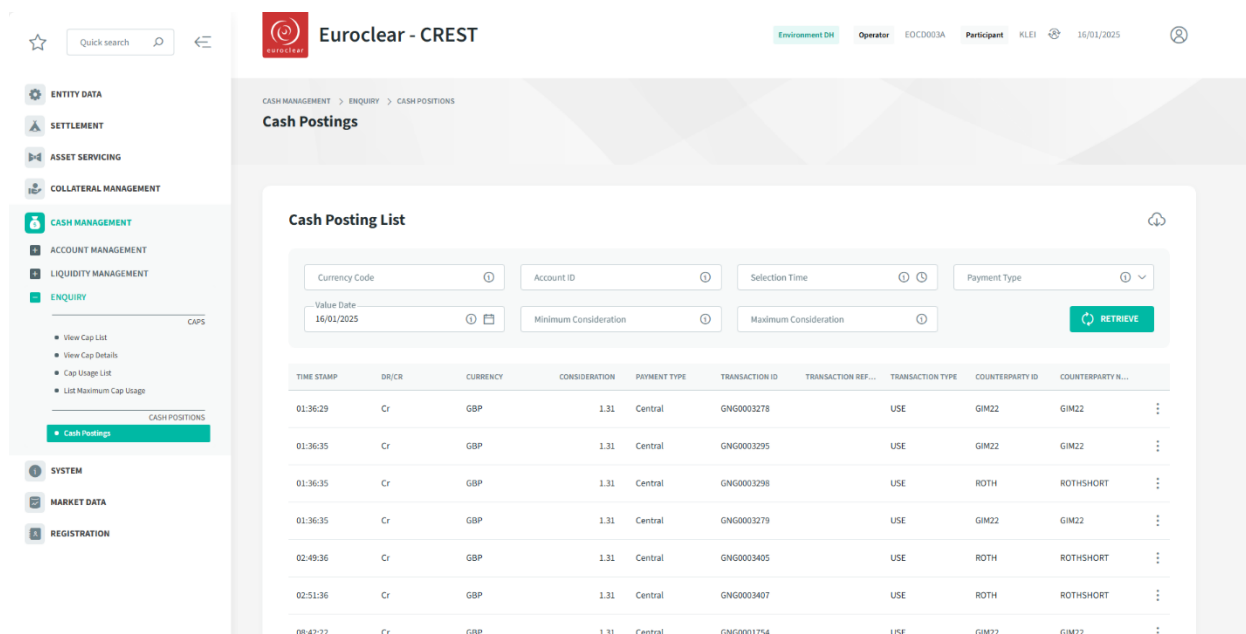

Figure 9

The menu opens on the left side of the screen. The path to the currently selected screen is highlighted in green (as shown in Figure 9).

3.1.4.2. Status Bar & User Session Menu

The Web GUI has a new interactive status bar along the top of the screen, replacing the status information that was in the bottom left of the legacy GUI. This contains the current environment and environment date, along with the current Operator Reference and Participant ID. The icon beside the Participant ID can be clicked in order to quickly open the Act as Participant window at any time.

Figure 10

Figure 10 shows a zoomed in view of the status bar, located in the top right of the screen.

The icon of the person to the right of the status bar will open the User Session Menu. This displays the Operator Reference again, the User ID and the Data Participant ID (which may differ from the function participant when the participant view function is in use). The user session menu also contains the Act as Participant and View Participant functions (View Participant becomes visible once acting as an initial participant) along with a link to the About CREST GUI page, CREST help file, the ability to change password and log out.

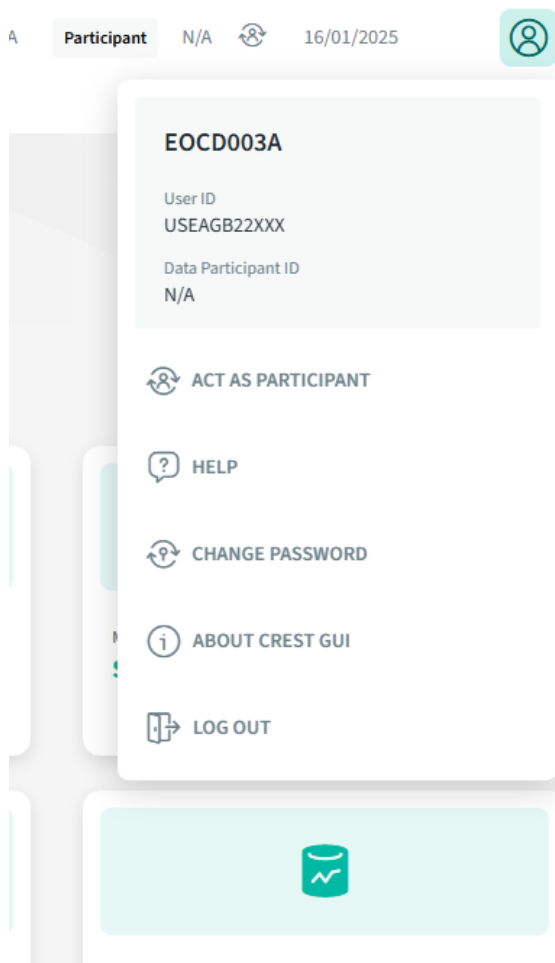

Figure 11

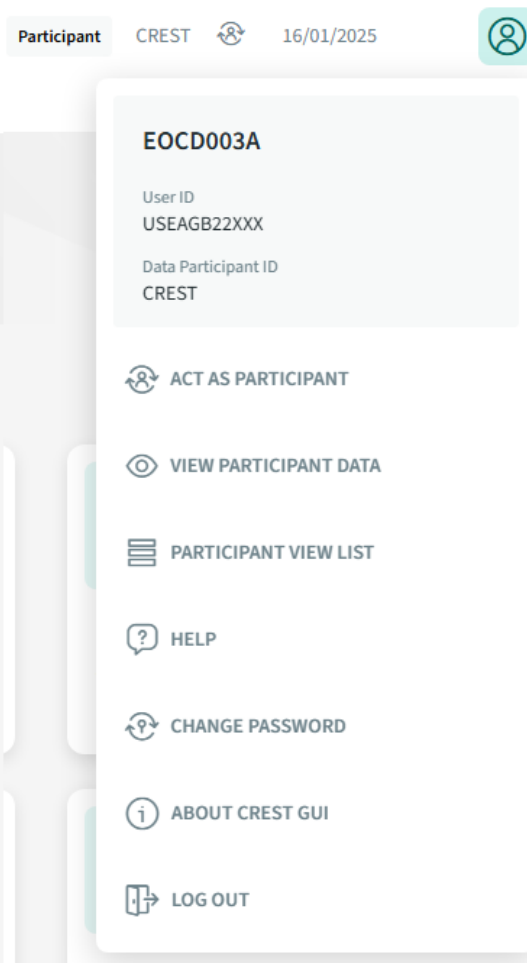

Figure 12

Figure 11 shows the User Session Menu while not acting as a member, whilst Figure 12 shows the User Session Menu while acting as a 'Member' type participant.

3.1.4.3. Favourites Function

The Web GUI provides the ability to 'favourite' specific screens. When hovering over a row in the menu that is not currently favourited, a hollow star icon will appear at the end of the row. Pressing the star will add the screen to your Favourites. Screens already favourited will show a filled star icon, even when not being hovered over. Pressing the filled star will remove the screen from favourites.

In the top left of the menu is a large star icon. Pressing once will open the favourites menu. Pressing again will return to the full menu.

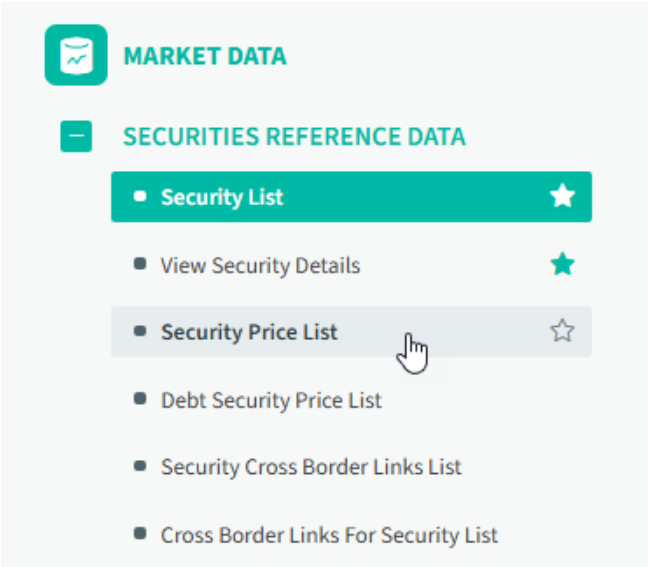

Figure 13

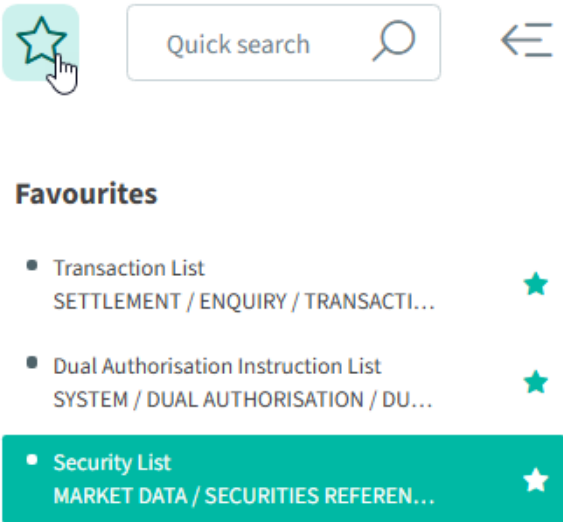

Figure 14

Figure 13 shows a close up of the menu with screens favourited, whilst Figure 14 shows the Favourites menu after pressing the large star icon.

3.1.4.4. Search Function

The Web GUI now provides a search function in order to quickly find specific screens. This is located at the top of the menu. Click in the Quick search box to start typing. The screens will immediately begin filtering as soon as typing begins, with the typed text highlighted in bold within each returned screen name.

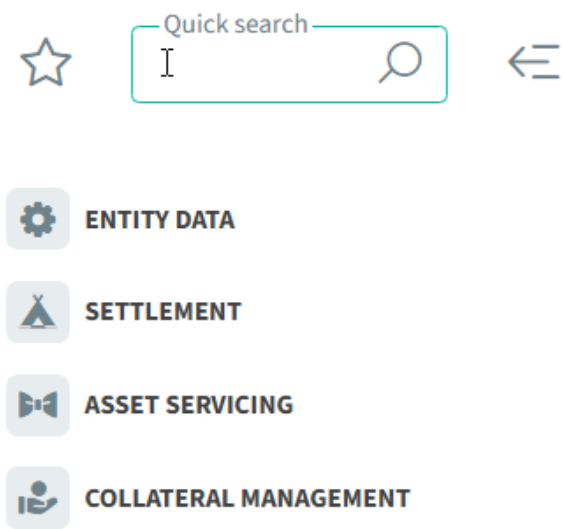

Figure 15

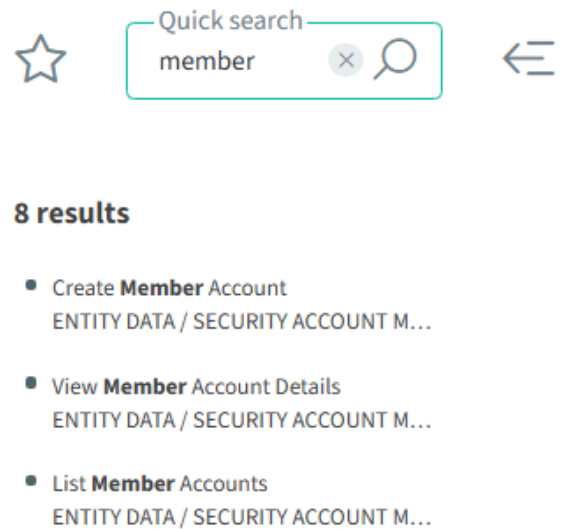

Figure 16

Figure 15 shows a close up of the menu before searching, whilst Figure 16 shows a close up of the menu after beginning to type in the search box.

3.1.4.5. Screen Name Changes

Certain screens have had their name updated to more accurately reflect their function. Many screens that have both input and amend functions have been split, with the screen name updated accordingly, e.g. *Delivery Details* becomes *Create Delivery Transaction* and *View Delivery Details*. See [Separation of Input & View](#).

Other name changes are as follows:

- *Option List/Transaction Corporate Action Option List > Buyer Protection Instruction List*
- *Claims > Market Claim List*
- *Strip > Gilt Strip*
- *Reconstitution > Gilt Reconstitution*
- *DBV List > DBV Instruction List*
- *Term DBV Transaction List > Term DBV Sibling Transactions*
- *DBV/Term DBV Details > Overnight/Term DBV Details*
- *DBV/Term DBV (Settled) Details > Settled Overnight/Term DBV Details*
- *Product Provider Dividend > Funds Dividend*

3.1.5. Workflow/Process Changes

3.1.5.1. Separation of Input & View

A key change to the workflow in the WebGUI is the separation of inputting data from viewing and amending data. The legacy CREST GUI housed all functions within the same screen, even if they were not relevant to the current context, for example an Add button being present when viewing an existing transaction, or Update and Delete buttons being present while attempting to create a new transaction. This can lead to confusing scenarios where it is unclear which button will lead to the desired outcome, especially for new users.

The screenshot displays the 'View Delivery Details' interface within the Euroclear - CREST system. The top navigation bar includes the Euroclear logo and the text 'Euroclear - CREST'. Below this, a breadcrumb trail indicates the path: 'SETTLEMENT > INSTRUCTION MANAGEMENT > DELIVERIES'. The main title 'Delivery Details' is prominently displayed, accompanied by a 'CREATE NEW' button. The 'View Delivery Details' section features input fields for 'Transaction ID' (GNG0000245) and 'Transaction Reference'. Below these fields are tabs for different transaction types: 'TRANSACTION', 'PARTY', 'SHARED', 'STOCK' (selected), 'CASH', 'TRANSFORM', 'INTERNATIONAL', 'CERTIFICATION', and 'UNDERLYING CLIENT'. The 'Movement 1' section contains various fields for transaction details, including 'Debit Party ID' (BENN), 'Participant Name' (BENNSHORT), 'Credit Party ID' (KLEI), 'Participant Name' (SHORT KLEI), 'ISIN' (GB1000000023), 'Security Abbreviation' (GB1000000023 ABBRE), 'Quantity' (1,000), 'Special Condition' (checkbox), 'Country of Register' (GB), 'Bad Delivery Reason', 'Trade Currency', 'Trade Price', 'Group 1 Units', and 'Group 2 Units'. At the bottom right, there are 'DELETE' and 'UPDATE' buttons. The footer includes copyright information and social media links.

Figure 17

The WebGUI has divided screens that have the ability to create data as well as the ability to view, amend and delete existing data into their respective functions. This applies to all user-created transactions as well as many other screens. For example, *Delivery Details* becomes both:

- *View Delivery Details*, with a **Retrieve** button at the top of the page to fetch existing data, as well as **Update** and **Delete** buttons at the bottom of the page to make changes to the data (Figure 17 and 18); and
- *Create Delivery Transaction*, with a single **Submit** button at the bottom of the page, clearly indicating that the transaction will be created once pressed (Figure 19).

Figure 18

Figure 19

Certain *View* screens have links to Input screens based on context:

- The *View Delivery Screen*, when selected from the menu, contains a **Create New** button at the top, which will move to a blank *Create Delivery Transaction* screen when pressed. Many transaction view screens will also contain a context-based Copy/Match button.
- **Copy** is displayed when viewing either a matched transaction, or the current participant's unmatched input, and will copy all transaction details into the *Create Transaction* screen for the selected transaction type.
- **Match** is displayed when viewing an unmatched transaction alleged against the current participant, and will move to the *Create Transaction* screen for the selected transaction type with all details input by the counterparty already filled in.

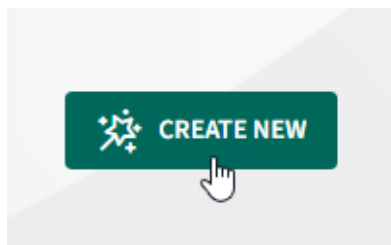

Figure 20

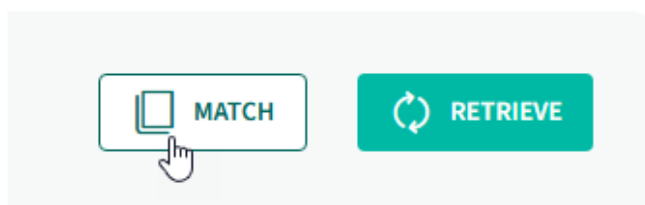

Figure 21

Figure 20 shows a close up of the Create New button, present in the top right of the screen when viewing certain types of transaction. Figure 21 shows a close up of the Match button, which will be present when viewing an alleged transaction.

3.1.5.2. Changes in button placement

In addition to the above change to separate certain buttons into different screens, some other changes to button placement have been made. Legacy CREST GUI screens can contain many buttons on the same screen, often performing different actions, sometimes directly interacting with the screen, such as Update, or opening other screens (see Figure 22 below).

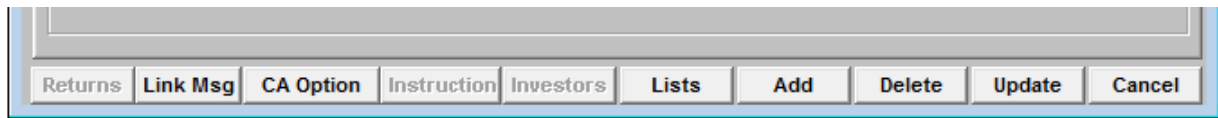

Figure 22

This could lead to situations where it is not clear if the button pressed is going to take an immediate action or open a separate screen before an action takes place. For this reason, main action buttons, that perform a function directly applicable to the screen (e.g. Retrieve, Submit, Update, Delete) will appear prominently on the screen, and other buttons that trigger a new screen have moved to the screen menu, located in the top-right of each screen, indicated by three vertical dots. The Save function has also moved to a Cloud icon and now allows for downloading all pages on additional screens, such as the Transaction List.

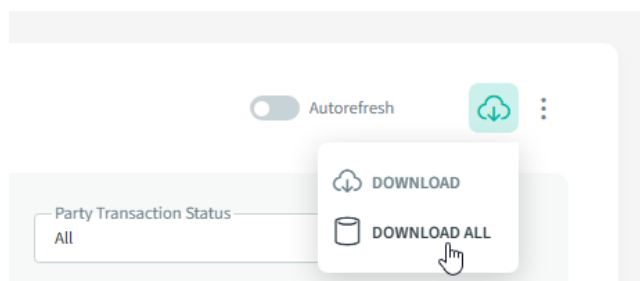

Figure 23: Shows a close up of the download icon menu after being pressed. 'Download' will save the current page, while 'Download All' will save all pages for the current filter criteria.

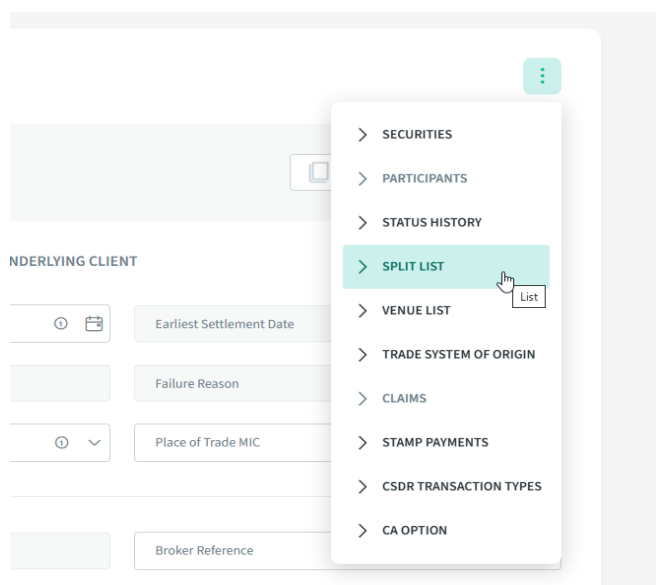

Figure 24: Shows a close up of the screen-specific menu, where other functions relating to the currently viewed screen are displayed.

3.1.5.3. Changes to List screen navigation

Navigating from a 'list screen' to a 'details screen' has been changed compared to the legacy GUI. Previously, when viewing a list, the details screen could be accessed by double clicking a row, or by single clicking a row before pressing a button along the bottom of the screen (usually, 'OK').

In the WebGUI, details screens can be reached from a list by pressing the button at the end of each row. Where viewing the full details is the only option, this will be represented by an eye icon. Where more than one option is applicable to each row, the options are nested within the menu located at the end of each row.

ISIN	SECURITY ABBRE...	QUANTITY	DR/CR	
GB1000000007	ABBREV 101	100	Cr	
GB1000000007	ABBREV 101	10,000	Cr	
GB1000000007	ABBREV 101	10,000	Cr	

Figure 25: A close up of a list screen where an eye icon is displayed at the end of the row.

UNSETTLED STOCK(CREDIT)	UNMATCHED STOCK(DEBIT)	UNMATCHED STOCK(CREDIT)	
0.00	0.00	100.00	
15	0		
0	0		
0	1,000	10	

Figure 26: A close up of a list screen where a menu is displayed at the end of the row.

3.1.6. Auto refresh

The WebGUI Introduces the ability for certain screens to refresh automatically. Screens that offer this feature contain the Auto refresh button in the top right of the screen pane, close to the menu with the three dots icon (Figure 27).

To enable the feature, first the Auto refresh toggle must be pressed. This will cause the 'minute' box to appear (Figure 28), where the refresh interval must be entered in minutes. Each refresh will reset the inactivity timer and prevent the operator from being logged out due to inactivity, but the value in minutes entered must be below the timeout threshold, otherwise the operator will have already timed out before the auto refresh takes place.

Once the feature is enabled and the interval has been entered, Retrieve must be pressed once to begin the automatic refresh cycle. It is clear when the automatic refresh is active, as the Last refresh indicator will display the time that the last set of data has been retrieved. Retrieval will continue if the browser tab remains on screen. If the screen is hidden for too long by navigating to a different tab or minimising the application, the browser may put the tab to sleep to save energy, which prevents the Auto refresh from functioning. Auto refresh cycles will continue once the tab becomes active again.

If the screen contains filter criteria to allow more specific results, this should be set before enabling Auto refresh or retrieving the first set of data. The automatic refresh cycle will then continue to fetch data based on the specified filters.

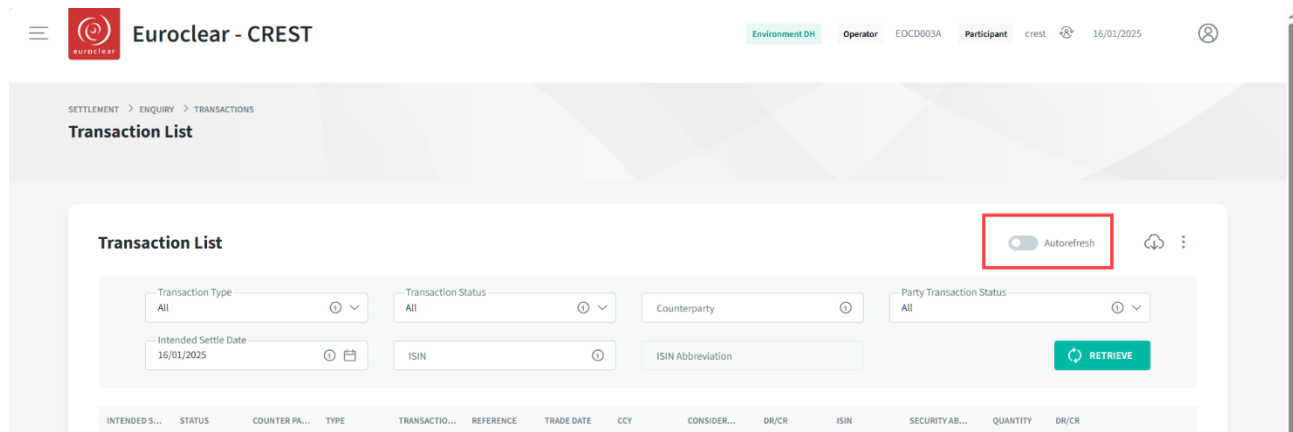

Figure 27

Figure 28

The list of screens for which Auto refresh will be enabled at the first launch of the Web GUI is as follows:

- *CREST Diary*
- *Transaction List*
- *DBV Instruction List*
- *Unmatched Transaction Postings*
- *Buyer Protection (ACON) Instruction List*
- *Liquidity Queue*
- *Bank Purchasing Power*
- *Cap Failure Enquiry*
- *Failed Transaction Enquiry*
- *Liquidity Position*
- *DBV Stock Valuation Total*

3.1.7. Dual Authorisation

A key functional enhancement introduced in the Web GUI is a workflow-based dual authorisation mechanism. This is designed to allow independent input and authorisation processes, resulting in a more efficient maker-checker model. In the legacy GUI, the authoriser was required to input their credentials directly on the inputting operator's workstation. In contrast, the new GUI records inputs requiring authorisation in a dedicated authorisation queue. This queue can be accessed independently by the authoriser, allowing them to review and approve items without relying on the inputting workstation. To support this functionality, a new set of screens has been introduced: **Dual Authorisation List**, **Dual Authorisation Details**, and **Audit Trail**.

The list of screens for which the new Dual Authorisation method will be enabled at the first launch of the Web GUI is shown below. Any screen not included in the list will retain the previous method of authorisation via a pop-up.

- *Transaction Details:*
 - *Input, Update & Delete functions: DEL, OAT, XDL, SLO, MTM, REG, USE, TTE, STW, STD*
 - *Update/Delete Functions only: DBR, DBI, TDI, XDR, SLR, SLD, TDR, CLA, STP, BDR*
- *Cap Details*
- *CMA Details*
- *Dividend Election Details*
- *Member Account Details*
- *Member Account Link/Delink*
- *MMI Issuance*
- *Proxy Instructions Details*
- *Split List*
- *DBV/Term DBV Instruction*
- *Stock Deposit Certificate*
- *Transformations - Options Input*
- *Investor Details*

Dual authorisation remains configured at the level of profile number assigned to each operator, so will automatically be enabled for operators already using existing dual authorisation for the included screens. Clients not currently using dual authorisation may wish to amend their operator profiles in order to take advantage of the enhanced functionality. Where a function is set to 'Full' access, inputs will be made immediately rather than moving to the Dual Authorisation instruction list. For inputs to move to the list, the operator profile access level must be set to 'Input' or 'Input or Authorise'. Help on configuring operator profiles can be found in the CREST WebGUI+ Operational Setup Guide.

When making an input, amendment or deletion on a supported screen with an access level requiring authorisation, a new pop-up will appear (Figure 29), which provides a Dual Authorisation ID and three options:

- **OK** will remain on the page containing the current input
- **CLEAR** will clear the form to allow a new input from scratch
- **EXIT** will return to the CREST homepage.

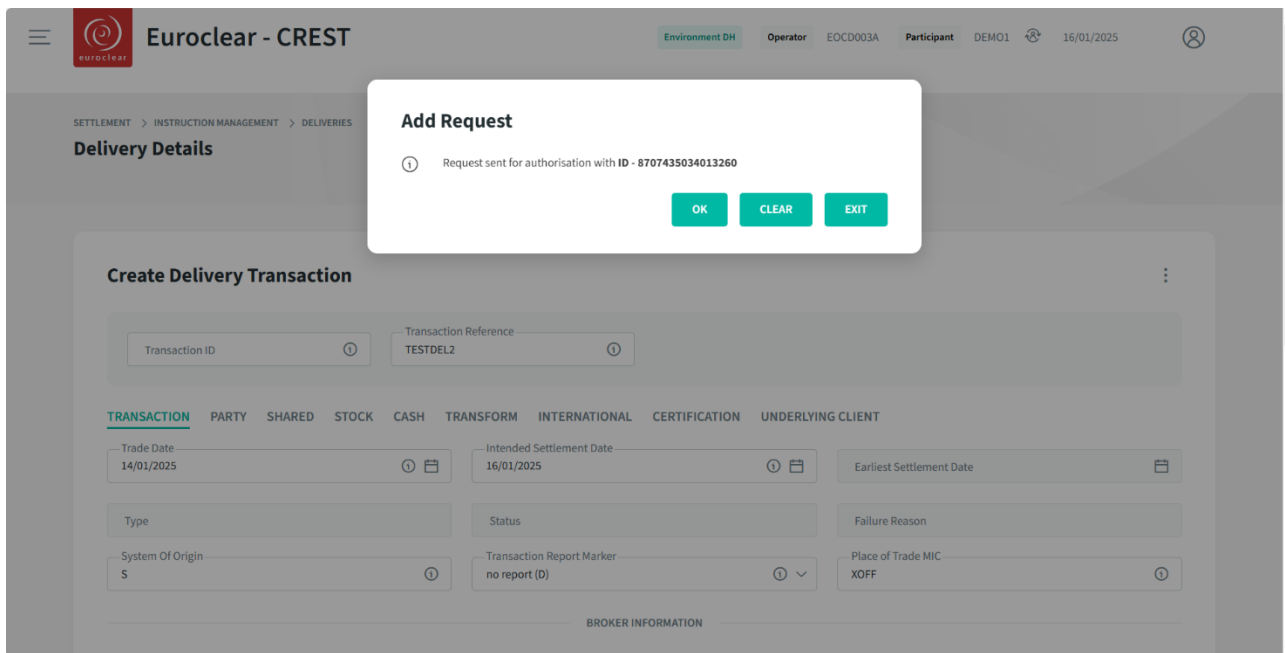

Figure 29

The Dual Authorisation Instruction List can be reached from the System menu. When not acting as a participant, all pending inputs are displayed in the list, which can be used to identify which participants have inputs awaiting authorisation, the type of function they are, and the operator who has made the input. To view full details of the input or take any action on it, the list must be viewed after acting as the relevant participant.

The list may be filtered by various criteria, such as the status, operator, function, the dual authorisation ID generated from the input, or based on whether the current operator has the required access level to authorise the input.

The menu at the end of each row is used to access the input details or view the audit trail (Figure 30).

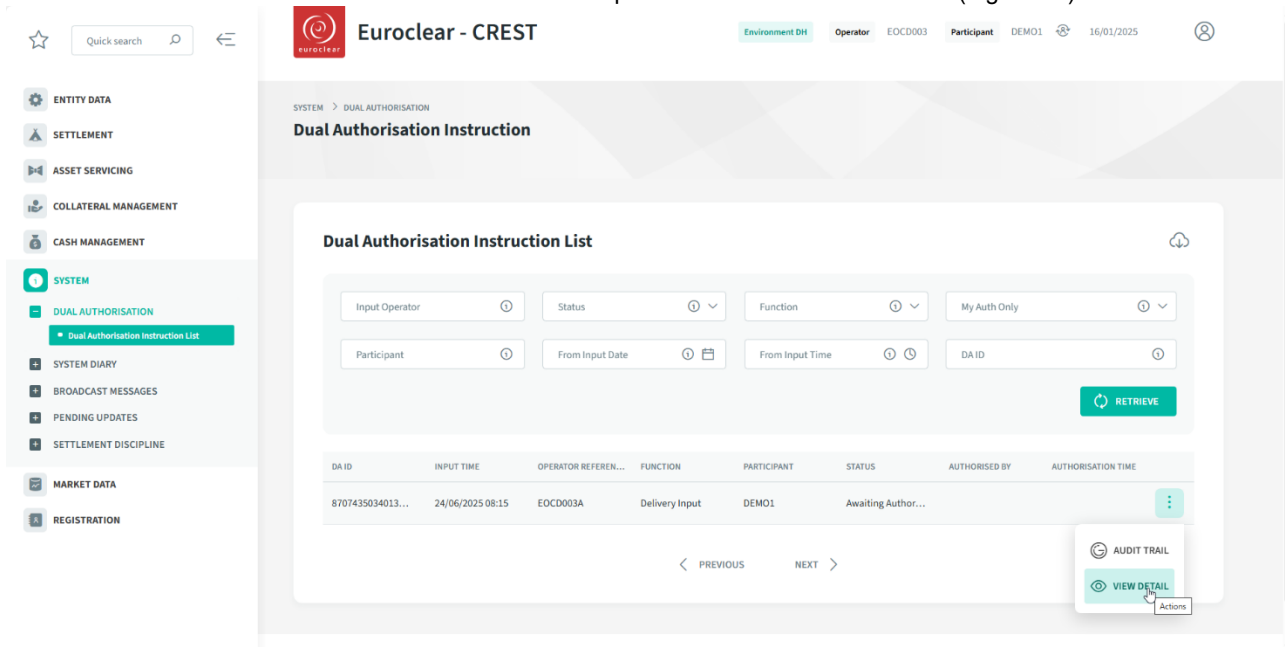

Figure 30

View Detail will open full details of the original input to view and add an Authorisation pane to the bottom of the screen, where authorisation actions are found (Figure 31).

- **CANCEL DA** cancels the entire input, preventing it from authorisation by anyone else. A new input must be instructed if required.

- **EDIT DETAILS** will unlock the input, allowing the details of the original input to be amended. This can be performed by the original inputter or by another operator with the required access level. However, if the amendment is made by another operator, they will no longer be able to authorise the instruction.
- **UPDATE** will apply the amendments made after pressing EDIT DETAILS and making changes.
- **RETURN FOR AMEND** allows an operator to leave a comment that is visible to other operators when they view the instruction, requesting changes to the input. This does not prevent subsequent authorisation, but it does change the status to 'Awaiting Amend', signalling that the instruction is awaiting changes. Once details are edited and updated, the instruction status will return to 'Awaiting Authorise' and clear the feedback comment.
- **AUTHORISE** allows an authorising operator to send the instruction for processing after leaving a comment. A message will be shown to confirm the success or failure of the input.

Figure 31

Audit Trail (Figure 32) can be reached from the list or an individual instruction. It displays a history of the dual authorisation input transaction from input to approval, showing the operators, dates and times, actions, comments, and status change as a result of each action. The audit trail can be viewed at any time in the lifecycle, before or after approval/rejection.

OPERATOR	DATE/TIME	ACTION	STATUS	COMMENT
EOCD003	24-06-2025 08:45	Authorise	Actioned	Approved
EOCD003A	24-06-2025 08:32	Input Replace	Awaiting Authorise	
EOCD003	24-06-2025 08:29	Return For Amend	Awaiting Amend	Please make corrections to quantity
EOCD003A	24-06-2025 08:15	Input Replace	Awaiting Authorise	
EOCD003A	23-06-2025 10:43	Input	Awaiting Authorise
